

# WATERGATE

## Tank to mains controllers

This version comprises of a fully enclosed weatherproof package. It consists of a moulded poly box with removable top for easy access. Inside is an electrically operated changeover controller and the option of a range of jet or multistage pump units. Optionally it can be linked to an in-tank submersible pump, where security is a consideration. The unit is designed to supply rainwater whilst the collection tank has storage, and divert to mains water if the storage tank is depleted. By means of a float switch it can recognise when storage water is again available and then switch back. The package is compact and appealing, with only 3 x 25mm BSP connections to be made. All fittings on the mains water supply points are "WATERMARK" approved. Simple to install, protected from sun and rain, reliable in operation.
